

Traffic Accident Analysis Project Report

Introduction

This project analyzes the US Accidents dataset using exploratory data analysis.

Objectives

Study weather, time, severity and hotspot patterns.

Tools

Python, Pandas, NumPy, Matplotlib, Seaborn, Folium.

Workflow

Load data, clean data, engineer features, visualize, generate insights.

Results

Rush hours show more accidents; poor visibility and adverse weather correlate with higher accident frequency; hotspot map highlights dense urban regions.

Conclusion

EDA provides actionable insights for road safety and future predictive modeling.
